Identification and molecular analysis of 32 kb homozygous deletion in a patient with Noonan syndrome. We describe the genetic basis of Noonan syndrome in a 16-year-old girl with characteristic facial features, cardiac defects, and growth retardation. Cytogenetic studies revealed a karyotype with 46, XX,t(5;9)(q34;q34) (9;10). In addition, analysis of a 10-month-old child with a phenotype of Noonan syndrome showed the same karyotype, but with a deletion of 1.6 Mb at 5q34. To further refine the genetic defect, we isolated total DNA from a cultured skin fibroblast cell line and determined the entire sequence of DNA markers on chromosome 5 (D5S436-D5S2903), including a cDNA fragment of Rho-GTPase activating protein 26. A homozygous deletion of the entire gene and surrounding region was detected. We also determined the promoter and the first exon
